"Comparison of Glucose Blood Levels in Cows in Physiological and Protracted Deliveries, and in Cows After Conservative Caesarian Section."

Prague, Veterinarni Medicina, Vol 11, No 7, Jul 66, pp. 413 - 419

Abstract [Author's English summary modified]: Glucose blood levels were investigated before, during, and after parturition. In physiological, protracted, and Caesarian section deliveries the peak of glycemia was at the culmination of the delivery. The highest values were found in the conservative Caesarian section. The cessation of the parturition activity is accompanied by a gradual decrease of glycemia up to the 4th to 6th day after delivery, when they sink to the levels common before the delivery. 1 Figure, 1 Table, 5 Western, 9 Czech, 1 Russian reference. AUTHORS : Furdík, M., Toma, Š., Suchý, J., and Flečko, P.

TITLE : Derivatives of ferrocene (II) and
derivatives based on diacetylferrocene - A method
for forming heteroannular rings

PERIODICAL : Chemické zvesti, no. 1, 1961, 45 - 62

TEXT : This paper is a continuation of the authors' studies
on aldol condensation of monoacetylferrocene with aromatic aldehydes
(Ref. 1: Chemické zvesti 14, 501 (1960)) and deals with the aldol
condensation of diacetylferrocene with aromatic aldehydes and the
influence exerted by the substituents and their position in the
benzene nucleus of the aldehyde component. Special attention was
paid to the question whether the second acetyl group condensates
with another aldehyde molecule or causes intermolecular cycli-
zation by the Michael addition on the double bond resulting from
the aldol condensation of the first acetyl group. The diacetyl-

Derivatives of ferrocene ...

ferrocene for the tests was prepared by Friedel-Crafts reaction of acetyl chloride with ferrocene under the catalytic influence of anhydrous aluminum chloride in CS₂. The aldol condensation was performed in methyl alcohol in which the reaction products were dissolved in a ratio of 1 mol ferrocene to 2 mol aldehyde catalyzed by diluted NaOH added at 40 - 50°C. Aldehydes used in the condensation were benzaldehyde, piperonal, o-chlorobenzaldehyde, o-, m-, and p-nitrobenzaldehyde, and furfural. The obtained condensation products could be crystallized with the exception of those obtained by condensation with o-nitrobenzaldehyde which had an oily character. In most cases with the exception of nitrobenzaldehydes, the color of the condensation products was considerably less intense than that of the corresponding product obtained by monoacetylferrocene condensation and that of the initial diacetylferrocene itself. From the distinctive change of the color, it could be derived that the ethylenic double bond, originating by condensation on the first

Derivatives of ferrocene ...

acetyl group, was saturated during the reaction, which could be effected either by an intramolecular Michael addition of the second intact acetyl group, or by intramolecular addition of the acetyl group of another diacetylferrocene molecule (Reaction scheme 2). By analysis of reaction products, especially of their infrared spectra, it could be determined that the Michael addition takes place during formation of a heteroannular 8-membered ring (including the Fe atom). It was thus ascertained that the condensation of diacetylferrocene with benzaldehyde, piperonal, o-chlorobenzaldehyde, furfural (and partially also with m-nitrobenzaldehyde) yields cyclic 1,1'-(α,α' -diketo- β -phenylpentamethylene) ferrocene or its derivatives respectively. Different products obtained by condensation with nitrobenzaldehydes showed an increase in color intensity. This led to the conclusion that the molecule conjugation increased considerably and that the Michael addition did not take place. This assumption was fully confirmed by the results of elementary

Derivatives of ferrocene...

analysis and infrared spectra of obtained condensation products. The nitro group with its -I effect and -M effect paralyzed the influence of the carbonyl group, so that the neighboring ethylenic double bond was not sufficiently polarized to allow the Michael addition. The only reaction taking place was, therefore, aldol condensation and the originating products of the 1-acetyl-1'-cinnamoylferrocene type maintained their ethylenic double bond and their intact second acetyl group. The small amount of heteroannular rings originating with condensation with m-nitrobenzaldehyde can be attributed to the weaker electron-attracting effect of the m-nitro group. In conclusion the authors state that the tests listed in this paper prove that the aldol condensation of diacetylferrocene with benzaldehyde, piperonal, o-chlorobenzaldehyde, furfural, and partially also m-nitrobenzaldehyde is accompanied by the Michael addition which leads to the formation of heteroannular rings. This

TITLE: Ferrocenes. (XI). Sythesis of halogen compounds derived from acryloyl-ferrocene

SOURCE: Chemicke zvesti, no. 5, 1965, 371-378

TOPIC TAGS: ferrocene, chlorinated organic compound, organic nitrogen compound, brominated organic compound, IR spectrum

ABSTRACT: [Authors' English summary]: The addition of hydrogen halides and halogens to acryloylferrocenes was investigated. An attempt to prepare Beta-halopropionylferrocenes was made. Starting with beta-halopropionylferrocenes and beta-diethylaminopropionylferrocene hydrochloride, 1-(p-nitrophenyl)-3-ferrocenyl- delta 2-pyrazoline was prepared by condensation with p-nitrophenylhydrazine. This was followed by cyclization. The infra-red spectra of this compound were also studied. "Engineer J. Krsk. of the Analytical Department of the Research Institute of Agrochemical Technology at Bratislava, is thanked for performing the analysis." A case of spinal cord compression in a 7-month-old infant by a malignant neuro-medulloblastoma (hour-glass type) is reported. The child was treated by partial excision of the tumour and postoperative X-irradiation. A survey of the literature concerning spinal cord compression caused by tumours up to the age of one year is presented. The last check-up 24 months after the operation showed considerable improvement of mobility of the lower limbs: the child could walk with help.

The authors describe a case observed clinically in a girl from the 12th day after birth, successively from the vesicular and bullous stages right up to the final pigmentations at 4 months. The partial success of treatment with ACTH is noted. In addition to the skin disease an anomaly of the teeth was also found. Both mother and grandmother of the child showed partial anodontia. Regarding the aetiology of the disease the authors place it into the group of ectodermal polydysplasias.

from just slaughtered healthy pigs, 71.4 percent of them fell sick and secreted viruses. When two strains of the Aueski virus were used in intracerebral inoculations of mice, they caused the animals to become sick (encephalitic syndrome and itch), beginning with the third subinoculation 6 hours after incubation, and after 8 to 16 hours, death of the animals followed. Hematological examination revealed that the afflicted animals are perpetually suffering from leucocytosis. The leucocytic formula was characterized by neutrophilia (88.8 to 92.8 percent), lymphopenia (4.7 to 8.2 percent), eosinophilia and basophilia, as well as the presence of plasmodiocytes and changes of the polynuclears and

TITLE: Methods of Determining Future Power Consumption

PERIODICAL: Elektrichestvo, 1959, Nr 8, pp 26 - 29 (USSR)

ABSTRACT: The various methods used in various countries for determining the dynamics of power consumption are mentioned. In this paper, an analytical method of determining the dynamics of the total consumption of heat and electric energy is presented, which proceeds by summing up the energy consumption in the individual branches of national economy, making use of the dynamics of the specific energy consumption and of the production rate in the industrial branch under consideration. This analytical method offers better results than conventional methods and is better suited to the requirements of a planned economy. The dynamics of specific energy consumption is determined from earlier statistical data. The future dynamics, however, is determined on the basis of objective criteria concerning the amount of specific energy consumption at the end of the period which is of interest. If the past and actual specific energy

Card 1/3

Methods of Determining Future Power Consumption

SOV/105-59-8-5/28

consumption and its amount at the end of the future period concerned are known, curves for the dynamics of specific consumption in the future period can be obtained. These curves can be expressed by the exponential equations (1) and (2). Experiments showed that the course of the curves corresponds to the process under review. If, however, the dynamics is to be determined only for short periods during which the specific energy consumption varies only little, and, besides, has varied only little in the past, the linear relationships (3) and (4) can be used by way of approximation. This method is used for the determination of the zone in the dynamics of specific energy consumption which lies between the curves (5), (6), and (7), (8) in the future period. The same method is applied to the dynamics of production, which is specified by curve (11) and shown by figure 3. If formulas (1), (2), and (11) are represented graphically, using a logarithmic scale for the ordinate, it is possible to obtain the results of each of these equations by adding the ordinates of the original diagrams (Figs 4a, 4b). The capital saved within a given period is obtained by integrating formula (25), which expresses the savings in the year t .

Card 2/3

Methods of Determining Future Power Consumption

SOV/105-59-8-5/28

Considering (1), (2), and (11), formula (27) is obtained. The capital saved within a given period can also be determined graphically, as explained and shown in figure 5. Formula (31) expresses the relationship between the capital savings L_1 in the year t_1 , the specific capital investment for the respective industrial branch, the period of redemption of these investments, and production capacity in the year t_1 . Families of straights can be plotted on the basis of formulas (25) and (31), each of which corresponds to a certain price level in the year t_1 . Figure 6 presents the diagram which permits determination of the economical equivalence of the dynamics of specific expenditures in the year t_1 . There are 6 figures and 3 references, 2 of which are Soviet.

The influence of capacitance and the charging currents in systems with earth return is investigated (see previous abstract). On the basis of theory and test results it is concluded that from the point of view of rating of the transformer the charging currents in a system with earth return can be disregarded in the same way as in a system with an insulated neutral. A simple method of measuring the displacement currents is also described.

so impulse tests on distribution transformers have been made. (Reference: IEEE Trans. on Power Deliv., Vol. 4, No. 4, 1979, pp. 275-282, 24 figs.)

Field reports on data were available in respect to the impulse strength of distribution transformers in service in Hungary. At the beginning of the investigation the existing tests have been analyzed to impulse test. With impulse tests, the results of which are not desirable to increase the test uniformity, the test conditions being internal fault, for instance, occur in the case of single-phase faults, where it is found that phase surges also occur in practice, the correctness of all the correctness of the single-phase impulse test had to be ascertained. Investigations of the internal voltage distribution made on transformers with grounded, respectively isolated, neutral showed that at the case of single-phase and three-phase surges are generally identical. Noteworthy dissimilarities can be observed only with transformers having isolated neutral. In the above mentioned position the tensions between windings and core are much greater with three-phase than with single-phase surges. Tests were conducted with full wave and with chopped waves in the case of which the Hagenguth method was applied. Oscillograms are furnished and evaluated. Finally, winding and line short circuits are illustrated in photographs.

"Seasonal Variations in Fertility and in the Incidence of Fetal Damage."

Budapest, Orvosi Hetilap, Vol 107, No 52, 25 Dec 66, pages 2466-2469.

Abstract: [Authors' Hungarian summary] On the basis of the 1957-63 data involving live, dead and premature births as well as spontaneous and induced abortions, the seasonal index of them and of conceptions was calculated. The number of live births exceeded the yearly average between Feb and May, and it remained below the average between Oct and Jan. Dead births were less frequent between Jul and Oct. There were no seasonal variations with respect to spontaneous abortions. Conceptions were less frequent during the late winter and early spring months and they increased in frequency during the summer months. They represent somewhat of a mirror image of the general mortality picture. 11 Eastern European, 59 Western references.

"On the Sodium Concentration of Normal Serum."

Budapest, Medvedorvos, Vol 15, No 1, Jan-Mar 63, pp 68-71.

Abstract: [Author's Hungarian summary modified] The sodium concentration of the sera of 140 healthy individuals was found to be 132-140 milliequivalents per liter, with a mean value of 136 meq/l. This is 4.9 % lower than the hitherto accepted mean. The serum potassium and chloride levels were found to be in agreement with accepted normal mean values. The author expresses the opinion that in view of his data one can conclude that the normal concentration of serum sodium has become lowered during the past 8-10 years. This change must be taken seriously since ultimately a slight deviation in the level of this most important cation of the extracellular space must represent a lesser or greater metabolic disturbance. Of 12 references, 5 are Hungarian, the rest is Western.

"Dye Dilution Method for the Determination of Plasma Remaining Around the Cells After Centrifugation of the Blood, the So-Called 'Trapped Plasma'."

Budapest, Honvedorvos, Vol XVIII, No 3, Jul-Sep 66, pages 238-242.

Abstract: [Authors' Hungarian summary] Following a brief discussion of the concept and importance of trapped plasma (with special reference to erythrocyte iron determinations), an extremely simple dye-dilution method of trapped plasma determination, using Evans' Blue, is described. By eliminating the hematocrit determination, the method equals or surpasses the sensitivity of the dye dilution and isotope methods of trapped plasma determination used earlier. On the basis of the results of 40 determinations each repeated twice, the trapped plasma content of normal human blood is given as 2.4 ± 0.49 per cent (range between 1.46-3.93 per cent). 3 Hungarian, 14 Western references.

"Determination of the Potassium and Sodium Content of Erythrocytes."

Budapest, Honvedorvos, Vol XVIII, No 3, Jul-Sep 66, pages 243-247.

Abstract: [Authors' Hungarian summary] The Na and K content of the red blood cells of healthy male and female subjects was determined. The determinations were made directly on the sedimented erythrocytes after hemolysis and protein precipitation with trichloroacetic acid. The final value of ion concentration was calculated from the amount of trapped plasma and from the known mass of erythrocytes as well as from the known ion concentration of the plasma. The amount of trapped plasma in the blood of healthy subjects showed significant differences even when sedimented under identical conditions. When this value was exactly known and suitable correction was applied, the normal Na concentration of erythrocytes was found to be lower and to have a considerably narrower range (10.39 ± 1.065 Mval per kg of erythrocytes) than the values reported earlier in the literature. The amount of K measured in the course of the present study was in agreement with the values reported in the literature (86.9 ± 2.46 Mval. per kg of erythrocytes). 5 Hungarian, 15 Western references.

"The Salt and Water Balance of Erythrocytes in the Course of Blood Storage
I. Changes in the Erythrocyte Magnesium Content of Acidic-Citrate-Glucose
(ACD) Blood."

Budapest, Honvedorvos, Vol XVIII, No 4, Oct-Dec 66, pages 308-312.

Abstract: [Authors' Hungarian summary] In the course of study of the salt and water balance of blood stored by means of different methods of preservation, the Mg metabolism of ACD-blood was also investigated. The K content of the erythrocytes of blood taken from 10 healthy subjects and stored using the ACD stabilizer decreased in the course of storage; at the same time, the Mg content of the cells remained virtually unchanged. On the basis of the results, it was concluded that a) the disturbance in glycolysis which develops during ACD-blood storage has no influence on the concentration gradient present between the extracellular and intracellular space with respect to Mg; b) Mg does not contribute significantly to the changes in total cation concentration which arises during storage; c) administration of ACD-blood is not suited for the correction of hypomagnesiemic states. 5 Eastern European, 23 Western references.
